### **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-3 and 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over McKee in view of Klein et al ("Klein", U.S. Patent No. 5,370,404). McKee discloses a seal for use adjacent to a rotating surface (12) comprising a ring (56) having a sealing surface (68) sealing between a portion of the stationary surface (48) and the sealing surface. The ring (56) is spaced from the rotating surface and has a race engagement surface (72) separate from the sealing surface. McKee also discloses a first race (16), a second race (38 or 40), and a plurality of bearing elements (34). While McKee describes features 56 and 58 as being cushioning elements, examiner notes this structure inherently provides a sealing function. For this reason, examiner considers 56 and 58 to be seals. McKee fails to disclose a metal-to-metal seal.
- 3. Klein teaches a sealing arrangement (4) between stationary surface and sealing surface. The seal provides a metal-to-metal seal (at 17, against 2). Ring 17 ensures reliable fixation of the seal arrangement within the bore, and creates a friction bond between the ring 17 and wall 2. Examiner considers this friction bond to be a seal. It would have been obvious to one having ordinary skill in the art at the time of the invention to modify McKee as taught by Klein, such that McKee's seal 56 includes metal reinforcement ring (17 of Klein) to ensure reliable fixation of the seal arrangement within the bore (Klein, column 4, lines 39-43).

Art Unit: 3677

- 4. With respect to claims 2 and 3, McKee discloses a bearing cage (36) disposed between first and second races, defining bearing openings. The bearing elements (34) are disposed in the openings. McKee also discloses the sealing surface (68) to be an outer peripheral surface of the ring.
- 5. With respect to claim 14, McKee discloses a stationary housing (48) having a sealing surface, a rotor assembly (12), a ring (56) having a sealing surface (68) sealing along a portion of the housing sealing surface and spaced from the rotor, having a bearing race engagement surface (72) separate from the ring sealing surface. McKee also discloses a first bearing race (16) engaging a portion of the rotor (12), a second bearing race (38 or 40) engaging the race engagement surface, and a bearing cage (36) defining a plurality of bearing openings disposed between the first and second bearing races. A plurality of bearing elements (34) are disposed in the bearing openings. McKee fails to disclose a metal-to-metal seal.
- 6. Klein teaches a sealing arrangement (4) between stationary surface and sealing surface. The seal provides a metal-to-metal seal (at 17, against 2). Ring 17 ensures reliable fixation of the seal arrangement within the bore, and creates a friction bond between the ring 17 and wall 2. Examiner considers this friction bond to be a seal. It would have been obvious to one having ordinary skill in the art at the time of the invention to modify McKee as taught by Klein, such that McKee's seal 56 includes metal reinforcement ring (17 of Klein) to ensure reliable fixation of the seal arrangement within the bore (Klein, column 4, lines 39-43).
- 7. With respect to claims 15 and 16, the housing sealing surface is substantially cylindrical and the ring sealing surface (68) is substantially concentric with the housing sealing surface.

  McKee also discloses the ring sealing surface (68) to be an outer peripheral surface of the ring.

Art Unit: 3677

8. Claims 12 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over McKee

Page 4

in view Klein, as applied to claims 1 and 14 above, and in further view of Ide (U.S. Patent No.

5,425,584). McKee and Klein disclose the bearings to be balls, not rollers, as claimed.

9. Ide teaches a bearing assembly that uses conventional rolling element bearing

components and rolling elements, such as balls or rollers (column 9, lines 24-29), thereby

establishing ball bearing and roller bearing as an art recognized equivalent, as either can be used

and still allow for proper functioning of the machine they are used in. It would have been

obvious to one having ordinary skill in the art at the time of the invention to use either ball or

roller bearings in McKee, as taught by Ide, as they are equivalent in the art.

10. Claims 6 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over McKee

in view Ide (U.S. Patent No. 5,425,584). McKee discloses the bearings to be balls, not rollers, as

claimed.

11. Ide teaches a bearing assembly that uses conventional rolling element bearing

components and rolling elements, such as balls or rollers (column 9, lines 24-29), thereby

establishing ball bearing and roller bearing as an art recognized equivalent, as either can be used

and still allow for proper functioning of the machine they are used in. It would have been

obvious to one having ordinary skill in the art at the time of the invention to use either ball or

roller bearings in McKee, as taught by Ide, as they are equivalent in the art.

Allowable Subject Matter

Application/Control Number: 09/920,682 Page 5

Art Unit: 3677

12. Claims 9-11, 22, 23, 32, 33, 35-43 are allowed.

## Response to Arguments

- 13. Applicant's arguments filed June 30, 2005 have been fully considered but they are not persuasive. On page 14 of the remarks, applicant argues that no mention is made of elements 56 and 58 in McKee being seals. Applicant states that dampening vibration alone does not make the elements capable of sealing. While this is true, examiner asserts the elements are capable of sealing. The elements are elastomeric elements that are pressed into face-to-face contact with the surrounding housing. This structural characteristic is common of many face seals well known with in the art. Examiner asserts the contact between the elements 56, 58 and surround structure will at least partially prevent movement of fluid therethrough. For this reason, examiner considers these elements to be seals.
- 14. Also on page 14, applicant states that sealing is not mentioned as a characteristic of reinforcement ring 17 in Klein. Similar to the reasons stated above, examiner considers this ring 17 to be seal because it the ring 17 will at least partially prevent passage of fluid between itself and the housing structure. If the ring 17 was spaced apart or not in contact with the housing, then it could not be said that the ring 17 is seal. However, Klein discloses there is a friction bond between the ring 17 and housing, or wall 2. This friction bond will inherently provide a degree of sealing.
- 15. On page 15, applicant argues that McKee teaches away from metal-to-metal contact because there would be nothing to absorb or dampen vibration, as the elements 56 and 58 are intended to do. Examiner respectfully disagrees. The result of the combination of McKee and Klein would not eliminate elements 56 and 58 of McKee, rather, it would add a ring (as taught

Art Unit: 3677

by Klein around the periphery if the elements. The elements 56 and 59 would still absorb and dampen vibrations. The reliable fixation taught by Klein, as a result of the ring 17, would prevent the elements 56 and 58 in McKee from becoming displaced or significantly deformed.

16. Applicant's arguments regarding the combination with the Ide patent relay on the alleged allowability of the claim rejected by the combination McKee and Klein. As addressed above, this rejection is maintained; therefore these arguments are not persuasive.

### Conclusion

- 17. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).
- 18. A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
- 19. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael J. Kyle whose telephone number is 571-272-7057. The examiner can normally be reached on Monday Friday, 8:30 am 5:00 pm.

Art Unit: 3677

20. If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Judy Swann can be reached on 571-272-7075. The fax phone number for the

organization where this application or proceeding is assigned is 571-273-8300.

21. Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
